

# Project ideas

| Project Name                      | Description   | Key Features   |
|-----------------------------------|---|--|
| <b>1. ATM Simulator</b>           | Simulate an ATM system where multiple ATMs handle transactions like deposits and withdrawals, check balance simultaneously. | Threads for each ATM, synchronization to avoid overdrawing, and transaction logging for shared accounts.                         |
| <b>2. File Search Tool</b>        | Create a tool that searches for a keyword across multiple text files in parallel.   | Assign threads to process different files concurrently, merge results into a summary, and display progress in a simple UI.       |
| <b>3. Movie Ticket Booking</b>    | Simulate a system where multiple users can book movie tickets at the same time.   | Threads for user booking actions, prevent double-booking with synchronization, and dynamically update seat availability.         |
| <b>4. Multithreaded Timer</b>     | Build a timer app that allows multiple timers to run independently and notify users when time is up.                        | Each timer operates in its own thread, with options to pause, reset, or add new timers dynamically.                              |
| <b>5. Task Reminder App</b>       | Develop a reminder app that handles multiple reminders running concurrently.  | Threads for individual reminders, notifications when reminders are triggered, and options to edit or remove reminders.           |
| <b>6. Document Processor</b>      | Process large text documents by splitting them into chunks and handling them in parallel.                                   | Threads process sections of the document independently (e.g., counting words), then merge results into a final output.           |
| <b>7. Weather Data Aggregator</b> | Simulate a system that collects weather data for different locations simultaneously.  | Threads fetch and process data for various locations, consolidate the results, and refresh periodically with thread scheduling.  |
| <b>8. Online Quiz Platform</b>    | Create a simple quiz app where multiple users take quizzes at the same time.  | Threads for handling user sessions, synchronized access to shared resources like the question bank, and real-time score updates. |
| <b>9. File Downloader</b>         | Build an app that downloads multiple files concurrently.  | Threads handle file downloads in parallel, track progress for each download, and consolidate all files into a specified folder.  |

|                                 |   |   |
|---------------------------------|---|---|
| <b>10. Social Media Fetcher</b> | Design a tool that fetches posts or content from different social media platforms simultaneously. | Threads fetch data from different sources, consolidate results into a feed, and refresh content periodically. |
|---------------------------------|---|---|

## Evaluation Criteria

| Criteria                       | Marks    | Explanation   |
|--------------------------------|----------|---|
| <b>Multithreading</b>          | <b>5</b> | <ul style="list-style-type: none"> <li>Did the project make effective use of threads?</li> <li>Were issues like race conditions and deadlocks avoided?</li> </ul> |
| <b>System Complexity</b>       | <b>4</b> | <ul style="list-style-type: none"> <li>Does the project reflect a realistic and challenging problem?</li> <li>Is it modeled after real-life systems?</li> </ul>   |
| <b>Performance Improvement</b> | <b>3</b> | <ul style="list-style-type: none"> <li>How much faster or more efficient is the system with multithreading compared to a single-threaded version?</li> </ul>      |
| <b>Functionality</b>           | <b>3</b> | <ul style="list-style-type: none"> <li>Does the system achieve its goals?</li> <li>Are all main features implemented and working as intended?</li> </ul>          |
| <b>Code Quality</b>            | <b>2</b> | <ul style="list-style-type: none"> <li>Is the code well-written, easy to understand, and modular?</li> <li>Does it follow good programming practices?</li> </ul>  |
| <b>Creativity/Innovation</b>   | <b>2</b> | <ul style="list-style-type: none"> <li>Did the team come up with creative solutions or add any unique features to enhance the project?</li> </ul>                 |
| <b>Documentation</b>           | <b>1</b> | <ul style="list-style-type: none"> <li>Is the project well-documented?</li> <li>Are the implementation details and usage instructions clear?</li> </ul>           |
| <b>Presentation/Demo</b>       | <b>1</b> | <ul style="list-style-type: none"> <li>Was the project presented clearly?</li> </ul>  |

- |  |  |  |
|--|--|--|
|  |  | <ul style="list-style-type: none"><li>• Did the team effectively demonstrate how their system works?</li></ul> |
|--|--|--|

Notes:

- All Projects Must have GUI.
- GUI Must Have a Separate thread to avoid UI Hanging.
- All projects must handle thread safety.
- Avoid Deadlocks and starvation.
